

CS5001 Networking

- I have implemented a web server which initializes on the port provided through command line and the web directory provided.
- I have also implemented the return of binary images through the web server.
 - For this, I have just added new return types to the method that returns content type
- Then, I have made an attempt at multi threading.
 - For this, I have implemented the Runnable interface and placed my main functionalities inside the run method
 - But, was unable to implement completely
- I also implemented logging which logs information in a “log.txt” in the source directory.
 - I have implemented the code in such a way that when you run the server, each request is logged into a log file
